

a

Matched Q3 segments

**b**

PQE scale trend (Q3 SPJ)

Q3 SPJ PQE, per-token $p=0.5$. Probability parity is EXACT (both compute $0.5^3=0.125$ per answer). ProVSQL = honest per-answer probability_evaluate (materialized, not the count(*) pruning artifact); ours (stock engine + client compiler) tracks it $\sim 2\times$ faster with no engine fork.
