

**a****b**

Q3 SPJ,  $p=0.5$ ; probability parity EXACT (both  $0.5^3=0.125/\text{answer}$ ). ProvsSQL = honest per-answer probability\_evaluate (protocol-sensitive: 3.5–7.5 s at SF0.01). Ours' engine-side construct scales  $\sim$ linearly and stays competitive; the full ours pipeline adds client compile+WMC — WMC tiny, but a naive global variable ordering costs 3.3 s at SF0.01 (pure-Python, removable). END-TO-END under one protocol (CANONICAL): ours 6.4 s  $\approx$  ProvsSQL 7.46 s at SF0.01 — comparable, no engine fork.
